

# THE BIG IDEA

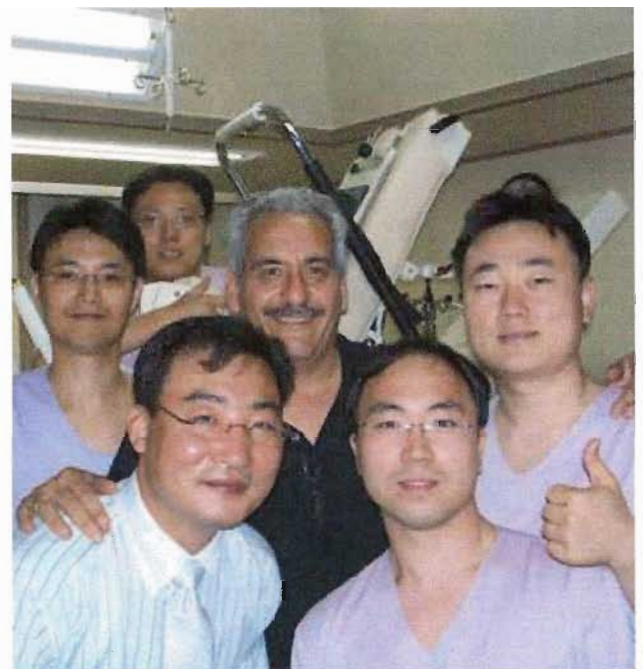

Twenty years ago a woman went to Dr. David Cuccia, a Syosset Chiropractor, with complaints of pain and difficulty walking. She was bent at a 30 degree angle with severe pain in her leg. After several weeks of traditional chiropractic manipulation she was no better. Dr. Cuccia was frustrated that he just could not achieve the spinal manipulation that she needed. During our interview, he told me "I was deeply moved by her pain, and got the idea of putting her on my back. We stood back to back and looped our arms together and I lifted her onto my back." This was a new modality in manipulation. Traditionally, the back would be bent forward, not backward, to alleviate the pain from a herniated disc. Dr. Cuccia's move was a new concept, to send the protruding disc backward instead of forward. When he put her down she stood straight, her posture was corrected and the pain in her leg was gone for the first time in six months.

It was at that moment that Dr. Cuccia was able to visualize the principles of bio-mechanics--incorporating traction with multiple, different spinal positions. From this came the Extentrac, an articulated table that facilitates decompression of the spine. This is not your ordinary "traction table". The machine stands a full 7 feet tall and has a great number of "positions" to put your body in, not unlike the Medieval "rack." The flexibility and modality of

the machine positions the patient in 3 D (Dimensional) positions to accommodate completely individual diagnoses and pathology. This flexibility provides for improved, maximal clinical efficacy and effect -a truly unique customized treatment is therefore designed for each individual patient. These are the FDA cleared indications of use for the Extentrac Elite Therapeutic Device.

Dr. Cuccia has spent the last year travelling the world with his machine training in installations of hospital around the world of MD's (not chiropractors) learning Extentrac Elite device's operation and Dr. Cuccia's non-surgical protocols for the treatment of pain from herniated discs, bulging discs, sciatica, degenerative disc disease, and facet syndrome.

He's taken it to South Korea where physical therapists in the 2nd largest surgical spine center in Korea, Hongik Hospital, have received personal instruction in the use of the Extentrac Elite and are very satisfied with it's non-surgical protocol. Doctor Layal, in Beirut, Lebanon, treats scores of patients daily with more lined up waiting for their turn.

The Moscow Rehabilitation hospital utilizes the Extentrac Elite for lower back pain and dysfunction, with good results. In fact, the patient results are resulting in many reorders of the device into

additional hospitals through out Russia, where the latest installation was to a Russian neurologist in the Russian City of Sochi – future site of the 2014 Olympics. Athletes from all over the world will be utilizing the healing effects of the Extentrac Elite for improved athletic performance and prevention of injury. The units are now in use in Greece, Russia, Korea, Canada, USA, Lebanon, Kuwait, and soon to be in India, Turkey, and Romania.
